

Attachment to BWSC-103

**Buckley & Mann Site
Norfolk, Massachusetts
MassDEP RTN: 2-3000173**

This revised release notification form is being submitted to document the detection of antimony, cadmium, and 2-methylnaphthalene in soil samples above Reportable Concentrations for Category S-1 soil (RCS-1) during sampling activities conducted on March 12, 2018 in the Carbonizer Lagoon at the former Buckley & Mann Site. These exceedances were documented in a laboratory data report dated March 22, 2018. These detections do not represent a new reporting condition, since metals and PAHs are already the focus of the existing Release Tracking Number (RTN). However, they are being added to the existing RTN in the interest of completeness and transparency.
