## **1. INTRODUCTION**

---

### **1.1 Purpose and Organization**

This Five-Year Periodic Review of the Temporary Solution Opinion has been prepared by Innovative Engineering Solutions, Inc. (IESI) on behalf of Massachusetts Electric Company d/b/a National Grid in accordance with the requirements of the Massachusetts Contingency Plan (MCP) (310 CMR 40.0000). This report presents the documentation for the Five-Year Periodic Review of the Temporary Solution for the former manufactured gas plant (MGP) site located in vicinity of Charles and Centre Streets along Commercial Street in Malden, Massachusetts. Figure 1 depicts the site locus and Figure 2 depicts the disposal site boundary and the partial Class C Response Action Outcome (RAO) boundary for which this report was prepared. The former Malden MGP is classified as a Tier 1B disposal site (with a Tier I permit number of 7378) and assigned Release Tracking Number (RTN) 3-0362 by the Massachusetts Department of Environmental Protection (MADEP).

A partial Class C RAO was submitted for the Site to the MADEP by Haley & Aldrich (H&A) in February 2004. As indicated in the partial Class C RAO, a Permanent Solution is not feasible because of the presence of non aqueous phase liquids (NAPL) and soil containing contaminant concentrations that exceed MCP Upper Concentration Limits (UCLs) beneath existing, active commercial buildings across the Site. The Phase III Remedial Action Plan (RAP), submitted to the MADEP in July 2003, recommended a remedial approach to reduce the quantity of NAPL in the subsurface at the Site, and to reduce VOC concentrations in soil, groundwater, and indoor air that may contribute to future potential exposure pathways for which a condition of No Significant Risk could not be satisfied.

Since this is a Temporary Solution, in accordance with 310 CMR 40.1051(3)(b), a periodic review must be conducted every fifth year after the date of filing the Class C RAO until such time that a Class A or Class C-2 RAO statement is submitted. In addition, in accordance with 310 CMR 40.1051(5), all Class C RAOs submitted to the MADEP prior to April 3, 2006 are considered a Class C-1 RAO until a RAO of a different Class RAO (i.e., Class A RAO, or Class C-2 RAO) is submitted.

This partial Class C RAO applies to the portions of the Site that have not had a Waiver Completion Statement or Class A or B RAO filed at the MADEP and excludes the Malden River portion of the Site. Parcel C (RTN3-2066) has a Waiver Completion Statement that was submitted to the MADEP in September 1990. Callahan Park which is located within a portion of Parcel D, is subject to an existing Partial Class A-3 RAO (RTN 3-13310) that was submitted to the MADEP in January 1997. The Malden River portion of the Site was addressed with a Class A-2 RAO submitted to the MADEP in July 2007. These portions of the Site are not included in this partial Class C RAO and will not be addressed in this periodic review. Refer to Figure 2 for a depiction of the Site boundary and the partial Class C RAO boundary that apply to the Site.

The contents of this periodic review have been structured to address the specific information requirements set forth in 310 CMR 40.1051 (3) (b) 1 through 7.

A copy of the Comprehensive Response Action Transmittal Form (BWSC Form 104) that was included with the electronic submittal to the DEP is included in Appendix A.

## **1.2 Site Location/Layout**

The former Malden MGP Site boundary and parcels of the MGP that are applicable to this 5-Year Review are identified in Figure 2 and described below:

- Parcel A contains approximately 2.8 acres and is occupied by six buildings (51 through 109 Commercial Street) on five separate properties. The parcel is bound by Commercial Street to the east, Charles Street to the south, a Massachusetts Bay Transit Authority (MBTA) Orange Line railroad right-of-way to the west, and Centre Street to the north. Current occupants of the buildings on Parcel A include: a bank, muffler shop, retail liquor store, rental car garage and office, tanning/nail salon, and medical offices.
- Parcel B contains approximately 2 acres and is identified as 129 Commercial Street and is occupied by a bakery. The parcel is bound by Commercial Street to the east, Adams Street to the south, MTBA Orange Line railroad right-of-way to the west, and Charles Street to the north.
- The portion of Parcel D that was not included in the January 1997 Partial Class A-3 RAO (RTN 3-13310) is included in this review. This portion of the Site is approximately 0.1 acre (not including the portion beneath Charles Street) and is part of the paved parking lot for Callahan Park and was formerly the location of the former MGP governor house which housed equipment (i.e., pipes and valves) used to regulate the flow of the manufactured gas.
- Parcel E contains approximately 6.6 acres and is identified as 100 Commercial Street. The property is currently owned (since August 2007) and occupied by National Grid (formerly KeySpan) and is used as an Operations and Vehicle Maintenance Center. The parcel is bound by the culverted Malden River to the east, Charles Street to the south, Commercial Street to the west, and Centre Street to the north.
- West End Brook and Malden Culverts: The portions of the West End Brook and Malden River Culverts that extend from Parcel D to the Malden River.

According to the MassGIS On Line Mapping website for “DEP Priority Resource (21E)” (<http://maps.massgis.state.ma.us/21e/viewer.htm>), except for the Malden River, no other surface water bodies, including wetlands, vernal pools, ponds, lakes, streams, rivers, Outstanding Resource Waters, and reservoirs, are located within 500 feet of the Site. Refer to Figure 4 for the DEP Priority Resource Map obtained from the MassGIS website. In addition, there are no Areas of Critical Environmental Concern, habitats, for Species of Special Concern or Threatened or Endangered Species, within 500 feet of the Site.

The Site is not located within any Current or Potential Drinking Water Source Areas as defined by 310 CMR 40.0006. Drinking water is supplied to the area by the Massachusetts Water Resource Association (MWRA). Although it is not known, it is very unlikely that private wells are located in the Site vicinity. The property is located in a medium yield Non-Potential Drinking Water Source Area. Callahan Park, a protected open space, is located west of the Site, beyond the elevated MBTA railroad tracks. Another protected open space, which is part of the Malden City Hall Plaza, is located approximately 300 feet northeast of the Site.

The residential population within a one-half mile radius of the Site is estimated at greater than 15,000 people. No institutions, as defined by 310 CMR 40.0006, are located with 500 feet of the Site. The Site is located within a designated Industrial Zone.

## **2. FEASIBILITY OF IMPLEMENTING ONE OR MORE PERMANENT SOLUTIONS**

---

**310 CMR 40.1051 (3)(b)(1)** **the feasibility of implementing one or more Permanent Solutions for the disposal site pursuant to 310 CMR 40.0861(2)(h) at the time of the Periodic Review; where one or more Permanent Solutions are determined to be feasible, a Class C-2 Response Action Outcome pursuant to 310 CMR 40.1051(4) shall be submitted in lieu of a Periodic Evaluation;**

As stated in the Phase III Report (H&A, 2003), to achieve a Permanent Solution, a condition of No Significant Risk must be satisfied for the Site, including elimination of soil UCL exceedences, and all source areas must be controlled or eliminated. At the former Malden MGP Site, this would involve the following (the italicized text was taken from the Phase III Report):

1. *Removal of LNAPL and DNAPL present at a thickness greater than ½ inch in any environmental medium at the Site.*

At the former Malden MGP Site, attainment of this NAPL (i.e., non-aqueous phase liquid) remedial goal is not reasonably feasible in the near term. Dense non aqueous phase liquid (DNAPL) and light non aqueous phase liquid (LNAPL) have been identified in monitoring wells and in soil in numerous locations at the Site. The Phase III estimated the total volume of DNAPL to be approximately 13,000 to 22,000 gallons and the total LNAPL volume to be approximately 8,000 to 11,000 gallons (based on NAPL thickness measurements in monitoring wells).

Based on the performance of the DNAPL recovery system present on 100 Commercial Street (further described in Section 4.1.1), NAPL extraction has had very limited success and a remedial response action capable of achieving the DNAPL and LNAPL remedial goals in a reasonable period of time has not yet been identified and likely does not exist.

It is also likely that NAPL may be present beneath buildings located within the site boundary, and therefore may not be extractable under current Site conditions.

2. *Elimination of soil material in which UCL exceedences have been observed, including contaminated soil and tar-saturated material (TSM), through either excavation, treatment or placement of an engineered barrier to eliminate potential exposure pathways to UCL exceedences.*

As indicated above, achievement of a Permanent Solution would also require elimination of the potential for exposure to UCL exceedences at the Site. Exceedences of UCLs in soil are considered to exist within the limits of tar-saturated material (TSM) contamination, which has been observed throughout the Site. The Phase II and Phase III reports indicate that TSM has been observed in approximately 5.6 acres. Achievement of a Permanent Solution through excavation of TSM and soil contamination is not reasonably feasible because a significant portion of this contamination is overlain by

buildings that are currently occupied by operating businesses. In addition, in-situ remediation methods for soil would not be effective until NAPL-phase contaminants have been removed from the subsurface; as discussed above, removal of NAPL-phase contaminants are likely not implementable, particularly beneath the occupied buildings on the Site.

Likewise, installation of an engineered barrier could achieve a Permanent Solution at the Site, however, this risk reduction measure is not currently possible because the presence of the buildings on top of soils contaminated at levels greater than the UCLs does not allow for construction of an engineered barrier. Although the presence of the buildings has eliminated potential exposure pathways, the buildings on the Site do not satisfy the MCP requirements for an engineered barrier. Therefore, reduction of contaminant concentrations on the Site to less than the UCLs is not feasible at this time.

*3. Remediation of soil with contaminant concentrations that preclude satisfaction of a condition of No Significant Risk, or mitigation of potential risk through AULs*

Similar to the issues presented above for addressing the UCL exceedences, in-situ remediation methods for soil would not be effective until NAPL-phase contaminants have been removed from the subsurface, and are likely not implementable beneath the buildings on the Site.

The main factors in the infeasibility of attaining a Permanent Solution at this Site are the costs and risks associated with the massive effort necessary for a limited overall reduction of risk. The costs of conducting, and risks resulting from, the necessary remedial action would not be justified by the benefits (i.e., incremental reduction of risk), considering the potential damage to the environment or health, the costs of environmental restoration, the long-term operations and maintenance costs, and nonpecuniary values.

Since submittal of the partial Class C RAO, Site conditions under which the infeasibility of attaining a Permanent Solution was determined have remained relatively unchanged. In addition, there are no complete exposure pathways to contamination present at the Site under current conditions.

The Disposal Site Boundary (not including the Malden River) covers roughly 18 acres of land which is divided as follows:

Callahan Park (partial A-3 RAO)	3 Acres
100 Commercial Street	6.6 Acres
89 Commercial Street	0.4 Acres
51 Commercial Street	0.5 Acres
129 Commercial Street	2 Acres
99 to 109 Commercial Street	1.1 Acres

65 to 77 Commercial Street	1.0 Acres
Streets (Commercial, Charles, and Centre)	2.4 Acres
Malden River Culvert (adjacent to 100 Commercial Street)	1 Acre

Of the 18 acres, National Grid currently owns 7.5 acres, and has excellent working relationships (albeit no formal agreement) with the City of Malden (6.4 acres) and the owners of 129 Commercial Street (2 acres).

When possible and reasonable, National Grid has purchased parcels of land that are affected by the MGP site. As an example, the 51 Commercial Street parcel was purchased by National Grid in 2005 and the 89 Commercial Street parcel was purchased in 2006. Further discussion of activities conducted and planned on each parcel since purchase is presented herein.

### **3. EFFECTIVENESS OF THE TEMPORARY SOLUTION**

---

#### **310 CMR 40. 1051 (3)(b)(2) the effectiveness of the Temporary Solution(s):**

The partial Class C RAO was achieved through previous and ongoing risk reduction measures and was based on a Substantial Hazard Evaluation that concluded that a condition of No Substantial Hazard exists for the terrestrial portion of the Site resulting in a Temporary Solution.

The previously completed risk reduction measures were summarized in the Phase III and Partial Class C RAO reports. The ongoing risk reduction measure that impacts the Substantial Hazard Evaluation is the sub-slab ventilation system (SSVS) operating at 129 Commercial Street. This system has been in operation since 1999. Immediate Response Action (IRA) and Release Abatement Measure (RAM) Status reports have been submitted every six months since that time. The risk characterization conducted as part of the Phase II, Phase III, and partial Class C RAO submittals have assumed continued operation of the SSVS at the 129 Commercial Street property.

In order to evaluate the SSVS System's effectiveness as a risk reduction measure, as part of the October 2008 RAM Status report, IESI updated the human health risk characterization for a current worker at 129 Commercial Street using data collected since 2004 including indoor air sampling conducted in April 2008 by IESI. The air samples obtained in April 2008 were analyzed using the Air Petroleum Hydrocarbon method and the results indicate that concentrations were comparable to previous events. The detected carbon range fractions were also included in the updated risk calculations. The updated human health risk characterization indicated that the Estimated Lifetime Cancer Risk (ELCR) for a residential exposure scenario (not an actual exposure, calculated for reference and comparison) was calculated to be 8E-06; the ELCR for the worker scenario was calculated to be 2E-06. These calculated ELCRs are both below the MCP limit of 1E-05. The Hazard Index (HI) for a residential exposure scenario was calculated to be 0.8; the HI for the worker scenario was calculated to be 0.2. Both calculated HI values are below the MCP limit of 1.

As they relate to Substantial Hazard Evaluation, conditions of the disposal site have remained relatively unchanged. Specifically, the current Site uses for each property within the Site boundary are generally unchanged, the SSVS installed at 129 Commercial Street remains in operation, and the risk estimates at 129 Commercial Street are less than MCP criteria.

IESI will continue operation, monitoring, and maintenance of the system and will continue to evaluate the system's effectiveness. In addition, periodic visits to the Site will be conducted to ensure that Site conditions and property uses remain unchanged. In addition, continued implementation of the definitive and enterprising steps summarized in the next section should eventually improve Site conditions.

## **4. DEFINITIVE AND ENTERPRISING STEPS TOWARD ACHIEVING A PERMANENT SOLUTION**

---

### **310 CMR 40. 1051 (3)(b)(3)    the definitive and/or enterprising steps taken to identify, develop and implement a feasible permanent solution at the site:**

The Phase III RAP that was submitted to MADEP in July 2003 concluded that a Permanent Solution was not feasible at the present time, due to the presence of LNAPL, DNAPL, and soil containing contaminant concentrations that exceed MCP UCLs beneath occupied buildings on the Site.

The Phase III RAP recommended a remedial approach to reduce the quantity of DNAPL and LNAPL in the subsurface at the Site, and to reduce VOC concentrations in soil, groundwater and indoor air that contribute to future potential exposure pathways for which a condition of No Significant Risk could not be satisfied. This remedial approach was presented as "definitive and enterprising steps" toward a Permanent Solution and is summarized below:

- NAPL recovery on Parcels A and E;
- In-situ chemical oxidation of accessible soils, if appropriate; and,
- Reduction of MGP residual concentrations in soil, groundwater and indoor air through the conventionally and/or horizontally installed biosparging and/or soil vapor extraction (SVE) systems on Parcel B.

The sections below summarize activities conducted that were taken since submittal of the partial Class C RAO that are definitive and enterprising steps to progress toward a Permanent Solution for the Site. In addition, we present a summary of the continued implementation of the definitive and enterprising steps to be taken at this Site.

### **4.1 Non-aqueous Phase Liquid Recovery**

NAPL recovery of the coal tar and associated MGP residuals are currently ongoing as a RAM on 100 and 51 Commercial Streets. NAPL recovery (in the form of coal tar) has been difficult with inconsistent success and recovery rates as summarized below.

#### *4.1.1 100 Commercial Street*

The NAPL recovery system located at the 100 Commercial Street (on a portion of Parcel E of the Site) was reactivated in August 2008 as a RAM. The system had been deactivated since 2003 because of slowed NAPL recovery. Prior to reactivation, the system was cleaned, checked and updated with new discharge tubing, a replacement extraction pump and confirmation that the fault switches (e.g., drum overfill, secondary containment, etc.) were working correctly.

Once reactivated, the system was checked periodically in an effort to calibrate the automatic pumps to maximize NAPL recovery and minimize groundwater recovery. During each visit, the recovery well was gauged, the system's safety interlocks were checked, the amount of NAPL and

water recovered was measured, and the thickness of NAPL in the recovery well was measured. Table 1 summarizes the data collected since reactivation.

As discussed in the August 2007 RAM Plan, the historic recovery rate of NAPL in 2001 to 2003 was high during initial activation of the system (up to 22 gallons per day) and fell to 1 gallon to 2 gallons per day following initial operation. As shown on Table 1, since August 2008 the initial rates of recovery were as high as 47 gallons per day then slowed to 1 to 0.5 gallon per day after 1 month of consistent operation.

The total amount of NAPL recovered since reactivation is 281 gallons. The total volume of NAPL collected since 2001 from this system is approximately 983 gallons.

This system has been effective in documenting the difficulties associated with NAPL recovery at this location. Since August of 2008, IESI has been evaluating the recovery rates and system operational parameters with the goal of maximizing automated NAPL recovery and potential expansion of the system.

IESI plans to propose enhancing NAPL recovery if a continued reduction in recovery rates is observed. The system will continue to be improved upon to increase its effectiveness as a risk reduction measure. Once a NAPL recovery method is proven to be effective on a larger scale, National Grid will consider expanding the NAPL recovery system. In the meantime, RAM Status reports will continue to be submitted to the MADEP as long as the continued operation of the system at 100 Commercial Street is cost effective and successful.

#### **4.1.2 51 Commercial Street**

National Grid purchased 51 Commercial Street in 2005. In 2006, IESI conducted a supplemental subsurface investigation in an effort to further define the extent of recoverable NAPL that may be present in the subsurface. Based upon this and historical investigations, the western half of the property is underlain by 2 to 7 feet of tar (i.e. NAPL) saturated soil, the southeastern quadrant of the property is underlain by less than 1 foot to 2 feet of tar saturated soil, and the northeastern portion of the Site is underlain by soil exhibiting a slight tar sheen or tar staining.

In 2007, National Grid leased the property to a local bank who proposed constructing a new branch office on the Site. Prior to construction of this building, IESI designed and installed a NAPL recovery system on the property as detailed in an August 2007 RAM Plan and subsequent RAM Status Reports. The August 2007 RAM Plan also included the necessary focused feasibility study when proposing new building construction on contaminated properties (in accordance with 310 CMR 40.0442 (3)). IESI has periodically monitored the seven extraction wells installed as part of the recovery system and, to date, NAPL has not been observed in any of the wells. IESI conducted a rigorous redevelopment of the wells in November 2008 with a vactor truck in an effort to induce DNAPL migration to the wells. IESI will continue monitoring the wells and as soon as recoverable NAPL is observed in the wells the NAPL recovery system will be activated.

## **4.2 In-situ Chemical Oxidation of Accessible Soils**

The partial Class C RAO identified in-situ chemical oxidation of soil as a potential step toward achieving a Permanent Solution for the Site. However, in-situ chemical oxidation is not anticipated to be cost-effective because of the presence of a highly organic layer that will have a significant oxidant demand in relation to that of the contaminants. Therefore, in-situ chemical oxidation of soil is no longer considered a step toward a Permanent Solution at this Site. National Grid will continue to identify and evaluate alternative methods of contaminant mass reduction as they become available for use under these Site conditions.

## **4.3 Reduction of MGP Residual Concentrations on Parcel B**

The SSVS system installed at the 129 Commercial Street property is currently removing sub-slab soil vapor from beneath the commercial bakery building. The system has been in operation since 1999. The Phase III RAP selected bio-sparging and SVE with the use of horizontal directional drilling as a potentially feasible alternative to remediate the contamination present beneath the building. In addition, HVAC system modifications were also identified as a potential alternative to reduce the migration of soil gas from beneath the floor slab to the indoor air.

In 2003, National Grid, with the cooperation of the building owners, completed an evaluation of the existing HVAC system and potential system modifications. The building is used as a successful commercial bakery and the owners were unwilling to make significant modifications to the system out of fear of the effect the changes could have on the bread products. In addition, as stated in Section 3, the continued indoor air monitoring has shown that the indoor air does not pose a significant risk to the current workers (or to potential future residential receptor, which is an unlikely use for this property).

The use of horizontal directional drilling (HDD) to install biosparge and SVE lines beneath the building is no longer considered feasible because of limited amounts of control HDD offers while drilling and the numerous subsurface obstructions likely to be encountered. The 129 Commercial street property has undergone significant redevelopment since use as part of the MGP site and the foundations, floor slab depth, and depth to ground water make installation of a SVE line by HDD infeasible. In addition, during conversations with HDD experts, National Grid learned that large volumes of an engineered drilling fluid are re-circulated within the borehole to stabilize the borehole and remove cuttings. The necessary shallow depths for SVE line installation coupled with the pumping of the drilling fluid could result in “breakouts” of drilling fluids (and contaminated material) within interiors of the building while drilling. The building owners would likely find this an unacceptable risk to their bakery operation.

## **4.4 Additional Risk Reduction Measures Conducted Since Submittal of the Partial Class C RAO**

### **4.4.1 51 Commercial Street**

In addition to the NAPL system installation, the August 2007 RAM Plan and the December 2007 RAM modification submitted to the MADEP for 51 Commercial Street included details for the

installation of a cap in the footprint of the building that was to be constructed. The cap was installed in such a manner that it would meet the requirements of an engineered barrier. This cap will not formally be called an “engineered barrier” at this time; however, if remedial actions in the future achieve a Permanent Solution, (with exception of soils containing oil and/or hazardous materials at concentrations exceeding UCLs) it may be desired to have the cap designated as an engineered barrier installed in accordance with 310 CMR 40.0996(4).

In December 2007, the cap was installed and consisted of two gas venting layers, a geotextile layer, and a 20 millimeter (mil) thick linear low density polyethylene (LLDPE) layer overlying the geotextile layer.

During construction between October 2007 and March 2008, approximately 2,340 tons of impacted material was removed from the property under a Bill of Lading (BOLs) and were transported to Environmental Soil Management Inc., (ESMI) of Loudon, New Hampshire.

#### **4.4.2 89 Commercial Street**

National Grid purchased the 89 Commercial Street property in 2006. The property is currently vacant and being offered for commercial lease. Similar to 51 Commercial Street, if a suitable tenant can be located, National Grid will evaluate any proposed construction, potential exposures and risk reduction measures that can be implemented. The existing wells will be included in the periodic gauging and sampling program. In addition, if NAPL recovery proves to be successful and cost effective at 51 Commercial Street, then a similar system would be considered for installation and operation at 89 Commercial Street.

#### **4.4.3 *Implementation of Partial Class A-3 RAO for the Former Governor House Portion of Parcel D***

An RAO has not been submitted for this Parcel D. An RAO is anticipated to be submitted for this Parcel in 2009.

#### **4.4.4 *Groundwater Sampling and Well Gauging***

A groundwater sampling event was conducted at the Site during February and March 2006 by H&A. During this sampling event, groundwater samples were collected from selected wells on the following properties: 129 Commercial Street (97B-B617-OW, 97B-B627-OW, 97B-B628-OW, GP98-103-OW, MW-1, MW-5, NC-2, and NC-3), Charles Street (97D-B619-OW, 97D-B621-OW, and B130-MW), Callahan Park (B104-MW, B116-MW, B118-MW, B124-MW, and B127-MW), and 100 Commercial Street (B106-OW, B112B-OW, B114A-OW, B15-OW, B16-OW, B-2-OW, B6-OW, B7-OW, B203-OW, B204-OW, and B205-OW). The majority of these wells were previously sampled in July 2000 and December 2000. The 2006 data indicate that no distinguishable concentration trends over time were noted in comparison to the 2000 data.

As a rough evaluation of the potential for groundwater to act as a source of indoor air contamination, concentrations of compounds in groundwater from wells located less than 30 feet from occupied buildings were compared to MADEP MCP Method 1 Risk Characterization Groundwater Category GW-2 criteria. Monitoring well 97B-B617-OW, located at 129

Commercial Street, was the only sampled well located within 30 feet of an occupied building that contained compound concentrations above the GW-2 Standards. The concentrations of styrene and xylenes were above GW-2 criteria in 2006; however, these concentrations were equivalent to the concentrations detected in 2000. In addition, indoor air is monitored in this building annually and the SSVS is operational.

Refer to Figure 5 for the location of the monitoring wells selected for sampling and Appendix B for draft tables provided by H&A for the groundwater data collected at the Site in July 2000, December 2000, and February/March 2006.

#### **4.5 Summary of Definitive and Enterprising Steps to be Continued at the Site**

In order to maintain the Temporary Solution and take definitive and enterprising steps toward reaching a Permanent Solution at this Site, National Grid will conduct the following activities:

##### **4.5.1 NAPL Recovery**

The NAPL recovery systems in place at 51 and 100 Commercial Street will remain in operation while recoverable thicknesses of NAPL are present in the recovery wells connected to the systems and removal of the NAPL is feasible under reasonable effort. IESI has recently experienced difficulty in NAPL recovery from the subsurface using conventional methods and will be proposing the evaluation of surfactants, additives and other NAPL recovery enhancement techniques if continued reduction of the rate of recovery is observed. These activities will be presented in the RAM status reports submitted every 6 months. If NAPL recovery proves successful using conventional and/or enhanced recovery methods, National Grid will evaluate expansion of the recovery system(s) if it can be done in a reasonable, cost effective manner without significant disruption of the businesses present.

##### **4.5.2 Evaluation of Innovative Remediation Technologies**

The environmental remediation science is constantly evolving and as new technologies become available that were not previously evaluated, National Grid will monitor and evaluate the technologies as they apply to the various contaminants and impacted media.

##### **4.5.3 Site Monitoring**

In order to ensure that Site conditions are maintained such that the Temporary Solution is maintained, the following monitoring activities will be conducted:

###### **Groundwater Gauging**

Wells located in areas identified as currently or historically containing NAPL will be gauged for the depth to water, and the presence/absence of NAPL, and the thickness of NAPL once every two years. These data will be submitted to the MADEP with the RAM status reports.

### Groundwater Sampling

Select groundwater monitoring wells will be sampled using low-flow sampling techniques and submitted to a laboratory for the analysis of extractable and volatile petroleum hydrocarbons via the MADEP Method. Additional analytes may be sampled for as determined by the LSP. Groundwater sampling will be conducted periodically such that each well selected for sampling is sampled once every three years.

### SSVS Operation

The SSVS system in place at 129 Commercial Street will remain in operation until the system is no longer necessary. The system will continue to be operated as a RAM and status reports will be submitted to the DEP every 6 months.

#### **4.5.4 Property Control**

National Grid will pursue outright purchase or placement of AULs on the private properties located within the boundaries of the Site as is reasonable and feasible. As shown by the purchase of 51 and 89 Commercial Street, National Grid desires to control, or at a minimum, restrict the use of the properties located within the Site boundary.

## **5. ADDITIONAL INFORMATION REQUIRED AS PART OF THE PERIODIC EVALUATION**

---

**310 CMR 40.1051 (3)(b)(4) any changes in activities, uses and/or exposures that may cause an actual or potential increase in exposure for human or environmental receptors to oil and/or hazardous material:**

Based upon a recent visit to the Site and periodic visits since 2004, there have been no significant changes in activities, uses, or exposures that could cause any increase in exposure to human or environmental receptors at this location.

**310 CMR 40.1051 (3)(b)(5) if applicable, an evaluation of any Activity and Use Limitation implemented as part of the Temporary Solution:**

There have been no AULs implemented as part of the Temporary Solution for the portion of the Site covered by the partial Class C RAO submitted in 2004.

**310 CMR 40.1051 (3)(b)(6) any necessary and required response actions to maintain the Temporary Solution and, if applicable, any Activity and Use Limitation, in the event that the Temporary Solution and/or the Activity and Use Limitation is no longer effective in maintaining a condition of No Substantial Hazard at the disposal site; such response actions shall be conducted in accordance with 310 CMR 40.1067**

RAMs are currently being conducted at the Site for 51 Commercial Street, 100 Commercial Street, and 129 Commercial Street. These RAMs are being conducted in accordance with 310 CMR 40.0896 in support of Post-RAO response actions. Only the RAM associated with the SSVS operation at 129 Commercial Street is considered necessary to maintain the Temporary Solution. The RAM for NAPL recovery at 51 and 100 Commercial Streets are considered definitive and enterprising steps toward reaching a Permanent Solution at this Site.

In addition, the biennial (i.e., once every 2 years) monitoring program outlined in Section 4.5 is considered necessary to ensure subsurface contamination conditions have not significantly changed from those that were observed during completion of the Phase II, III, and Class C RAO reports.

**310 CMR 40.1051 (3)(b)(7) the certification required in 310 CMR 40.0009.**

The certification required is on the attached BWSC-104 form

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data

## Notes:

1 NA: Not Applicable

2 VOC: Volatile organic compounds; SVOC: Semivolatile organic compounds

3 VPH: Volatile petroleum hydrocarbons; EPH: Extractable petroleum hydrocarbons

4 MCP: The Massachusetts Contingency Plan, 310 CMR 40.0000

5 --: Sample was not tested for this analyte

6 0 indicates no change, + indicates an increase, - indicates an increase between 2000 and 2006 GW data
